

Abstract

Improvements to the subject of the main patent No. 200102210 for an "Auxiliary element for the segmental distalisation of the canine-to-molar posterior maxillary area in orthodontic treatments"

The improvements are characterised in that the ball joint of the median segment is spherical with two diametrically opposed planar faces in the positions of polar segments of the sphere and the arm of the median segment is joined to the ball joint forming a small acute angle.
